Narratives

1. Briefly describe the artifact. What is it? When was it created?

As during the previous module, the selected artifact remains the same. It is the event planner application, which I originally created during the CS 360: Mobile Architecture and Programming class about a year ago. Up until the last module, the app had features for logging in, registering, creating, deleting, editing, and viewing events on a grid screen. As of now, I've tweaked the logic to allow users to filter events by keywords and sort by dates. These two new functions fit with the goal of applying data structures and algorithms to improve the app, as it uses both filter and sorting logic to accomplish the results. That said, both are very different. The filtering uses a search logic with a query, while the sorting features uses an ArrayList and sorting logic to display events from earliest to latest.

Events sorted by dates:

Filtering by name:

Error message when there aren't any matching results:

2. Justify the inclusion of the artifact in your ePortfolio. Why did you select this item?

What specific components of the artifact showcase your skills and abilities in software development? How was the artifact improved?

As previously mentioned, the artifact was one of the few projects from the approved course list that I still had at hand. Additionally, due to the nature of the app, it was the perfect playground to test algorithms and data structures to accomplish additional functions. It is an app that could be improved and polished in order to meet the course outcomes. That said, these specific enhancements focused on implementing search and filtering functionality for stored events. Users can now search events by keyword, and the events are sorted by date. These new additions are

perfect examples of algorithmic problem-solving. Lastly, the enhancements have now made this app a lot closer to a fully functional product that you'd see on app stores.

3. Did you meet the course outcomes you planned to meet with this enhancement in Module One? Do you have any updates to your outcome-coverage plans?

Yes, I do believe that the course outcomes associated with this module have been met. This is because the enhancement has been a great opportunity to tackle the outcomes associated with computing solutions using algorithmic principles. Both the search and sorting functionalities required a lot of research and different approaches to find a solution. The filtering method applies search logic to locate matching events, while the sorting enhancement uses an ArrayList and date comparison logic to sort events by date instead of displaying them in “recently-added” manner. Nevertheless, there are still other outcomes that can be met, and the project will continue to receive polishing until the end of class.

4. Reflect on the process of enhancing and modifying the artifact. What did you learn as you were creating it and improving it? What challenges did you face?

The biggest challenge was that the original file was convoluted and had no comments; I had to not only learn how everything worked but also run multiple tests to ensure I did not break anything. The programming was also difficult, as algorithms aren't my strongest quality. That said, the outcome is something that I'm proud of, and I learned how simple additional features can be challenging but also truly overhaul an application.
