

Overview

The event planner application is a very simple artifact to utilize. Navigation within the app is intuitive; however, getting it to run on your own could be difficult.

For versions 1.2 all the way back to the original, one can simply skip to the “Running the App” section. For the newest version 1.3, it is recommended to go over every step listed in this document.

Requirements

- MAMP (newest version)
- [Node.js](#) (newest version)
- MySQL through MAMP
- Android Studio (newest version)

Database Setup

Start MAMP and ensure that MySQL is running. The specific database for the project is titled “event_planner_db”.

Backend Setup

- Open the command line or PowerShell
- On the terminal or command line, navigate to the project folder.
- Navigate to the api folder.
- From the folder run:
 - npm install
 - npm start
 - Backend will start running.

Running the App

- Open the Android Studio app and select the right project folder.
- Select “Device Manager”.
- Start the emulator.
- Select “Run App”.

Note: For version 1.3 both MAMP and the backend API server must be running before starting the app.
